

APPENDIX G SLOPE STABILITY ANALYSIS

SLOPE STABILITY SUMMARY

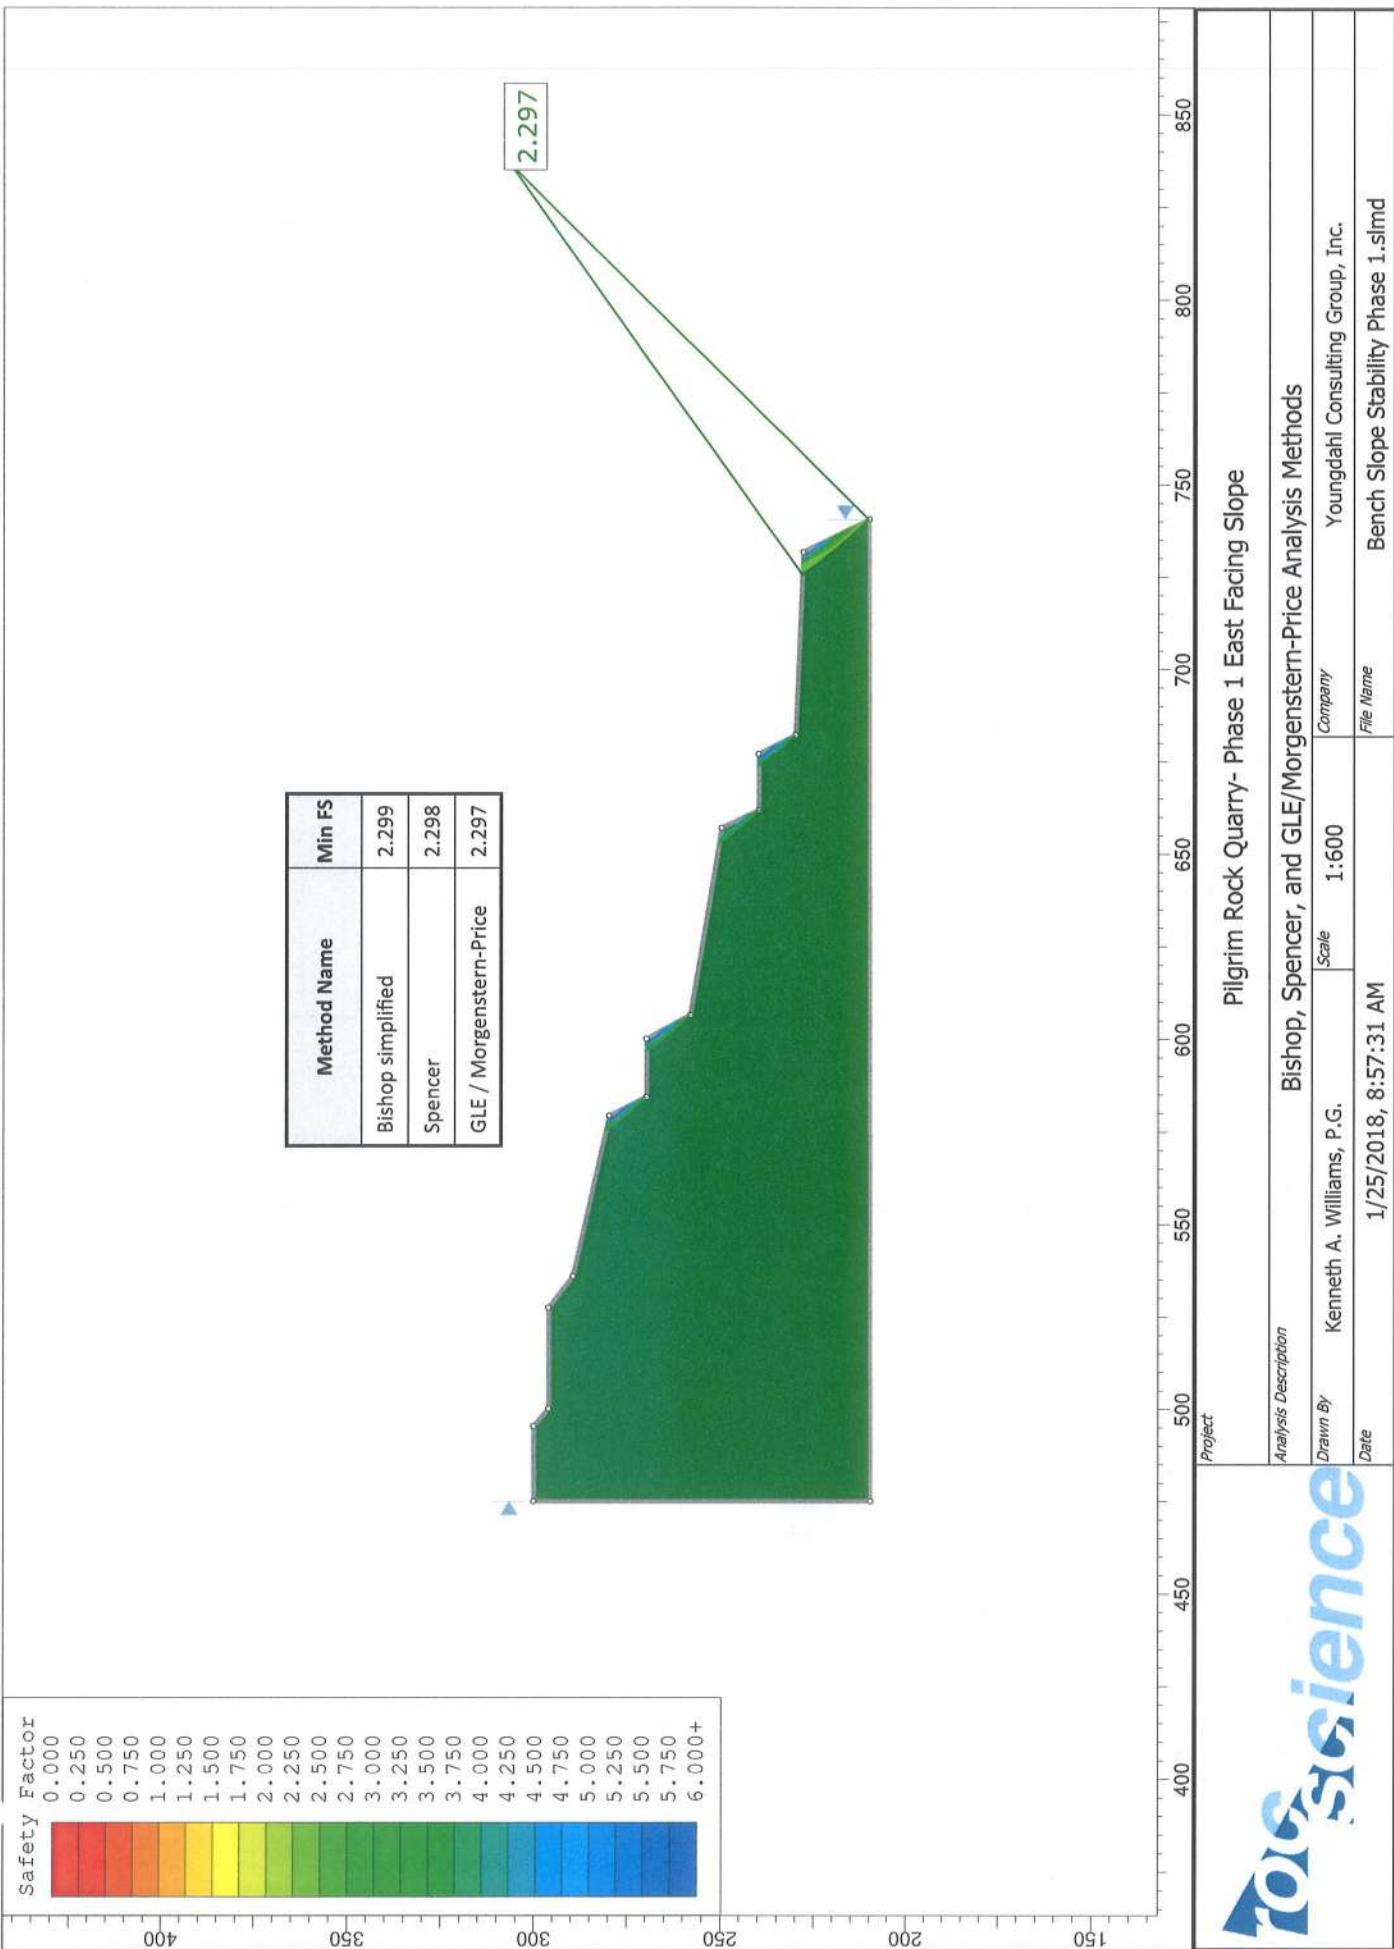

Youngdahl performed a slope stability analysis to calculate the stability of the proposed slope configurations. The slope model used was based on our observations of the soil and rock conditions revealed during a subsurface exploration using a HQ core rig, and from the material properties observed in the Gopher Ridge Geologic unit from two quarries within the region mining the same geologic unit. Our analysis was performed using Slide™ software utilizing the GLE/Morgenstern-Price, Bishop, and Spencer methods. *"Slide is slope stability analysis program for all types of soil and rock slopes. Slide includes built-in finite element groundwater seepage analysis, probabilistic analysis, multi-scenario modeling, and support design."*

The stability of a slope is evaluated by calculating its "factor of safety". The factor of safety is a ratio obtained by dividing the resisting forces (i.e., the strength of the material comprising the slope) by the driving forces (resulting from the slope gradient, groundwater, and earthquake loading). If the factor of safety is greater than 1, the slope is considered to be stable. A factor of safety less than 1 means the slope is considered to be unstable, and a factor of safety equal to 1 indicates being on the edge of failure. Typically, when evaluating slope stability, a static minimum factor of safety of 1.5 is considered to account for variability in groundwater, subsurface soil and rock conditions, and laboratory test results. A factor of safety of 1.2 is considered for pseudo-static conditions. (earthquakes)

Our slope stability analysis was based on the following assumptions and variables, including: the unit weight of the underlying unit is consistent at 170lbs/cubic foot, the friction angle (phi angle) of the material is estimated to be at 45 degrees with 500 pound per square foot cohesion, and free flowing fractures noted on well data completion reports and exploratory borings in the Gopher Ridge Volcanics geologic unit modelled. The unit was classified using a rock mass classification system which uses rock structure rating and rock geomechanics classification system rating. Considering rock structure rating, the unit is a hard to very hard metamorphosed andesite that is massive to slightly folded/faulted. The joint pattern was on average moderate to blocky and becoming massive at depth, ranging from 1-2 feet and over 4 feet. Anticipated groundwater flow is estimated to be none to negligible from tight or cemented joints. Using the geomechanics classification system the estimated point load strength is 4 to 10 MPa, Rock Quality Designation (RQD) at 75%-100%, slightly rough surfaces between joints to healed fractures, and groundwater estimated less than 10 gallons per minute yields good to very good rock to withstand the slopes modelled below. Based on our assumptions, we modelled the east facing slope in Phase 1, west facing slope in Phase 5, and Phase 5 inter-bench slopes with factors of safety of 3.788, 2.298, and greater than 9, respectively. The proposed slope angles of 1H:1V overall and inter-bench angles of 0.5H:1V are estimated to remain stable based on our assumptions. We recommend performing the analysis based on structural geology data collected annually.

Error Codes

The following errors were encountered during the computation:

- 103 = Two surface / slope intersections, but one or more surface / nonslope external polygon intersections lie between them. This usually occurs when the slip surface extends past the bottom of the soil region, but may also occur on a benched slope model with two sets of Slope Limits.
- 105 = More than two surface / slope intersections with no valid slip surface.
- 106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
- 108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
- 112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
- 114 = Surface with Reverse Curvature.

SLIDE - An Interactive Slope Stability Program

Project Summary

File Name: Bench Slope Stability.slmd - Group 1 - Scenario 1
Slide Modeler Version: 7.03
Project Title: SLIDE - An Interactive Slope Stability Program
Date Created: 1/19/2018, 2:20:58 PM

General Settings

Units of Measurement: Imperial Units
Time Units: days
Permeability Units: feet/second
Failure Direction: Right to Left
Data Output: Standard
Maximum Material Properties: 20
Maximum Support Properties: 20

Analysis Options

Slices Type: Vertical

Analysis Methods Used

GLE/Morgenstern-Price with interslice force function:	Bishop simplified Half Sine Spencer
---	---

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft ³]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed: 10116
Random Number Generation Method: Park and Miller v.3

Surface Options

Surface Type: Circular
 Search Method: Slope Search
 Number of Surfaces: 5000
 Upper Angle: -45
 Lower Angle: -45
 Composite Surfaces: Disabled
 Reverse Curvature: Invalid Surfaces
 Minimum Elevation: Not Defined
 Minimum Depth: Not Defined
 Minimum Area: Not Defined
 Minimum Weight: Not Defined

Seismic

Advanced seismic analysis: Yes
 Locate surface with minimum critical horizontal seismic acceleration (Ky): Yes
 Target factor of safety: 1.3
 Using Newmark analysis: No
 Staged pseudostatic analysis: No

Error Codes

The following errors were encountered during the computation:

- 103 = Two surface / slope intersections, but one or more surface / nonslope external polygon intersections lie between them. This usually occurs when the slip surface extends past the bottom of the soil region, but may also occur on a benched slope model with two sets of Slope Limits.
- 105 = More than two surface / slope intersections with no valid slip surface.
- 106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which

may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-111 = safety factor equation did not converge

-112 = The coefficient M-Alpha = $\cos(\alpha)(1+\tan(\alpha)\tan(\phi))/F < 0.2$ for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-114 = Surface with Reverse Curvature.
